Preface

It has been my great pleasure to write and help design SouthWild's first official Jaguar Dossier. Since 2006, when we started working with Jaguars in the north Pantanal, we have been identifying unique individuals and cataloging them in an ever-expanding PowerPoint presentation that has been passed down from Naturalist to Naturalist. In 2022, just two weeks after graduating from the University of California, Santa Barbara, with my B.S. in Ecology and Evolution, I found myself suddenly in charge of this long-running slideshow and was located smack dab in the middle of Jaguarland for the next 6 months.

I actually began writing the history of the Jaguar while I was still in college. I thought it was a simple commission to research and write about the Jaguar's journey into the Pantanal, and what college student would refuse the chance to make a bit of cash on the side? For the next two weeks, I searched for peer-reviewed research papers on the evolution of Jaguars and their passage into South America. I had to extract information from 10+ sources to create a cohesive story that spans millions of years. After copious amounts of research and note taking, hours of editing and revisions, I had finally finished the commissioned assignment. I am so proud of it! I hope that when you read "the History of the Jaguar", you will grasp the thorough research behind it.

After graduating, I flew out to the Pantanal to work as the leading Jaguar Naturalist and Jaguar Suites Manager for the 2022 season. When I accepted this job, I didn't realize how attached I would become to my role in giving our Jaguars their identity. I have a deep appreciation for being able to look at a cat and know exactly who it is, how it behaves, where it likes to hang out. It truly shifts

one's perspective on wildlife. What does it even mean to be wild? It is simply their life, and we are not all that different in the end.

When my time as the Naturalist came to an end, I was offered the chance to continue my work with SouthWild, and the first order of business was finishing the layout of the Jaguar Dossier that had been left untouched since my commission all those months ago. With nearly 230 individual cats and 1-3 images per cat, you can imagine it took quite a while to painstakingly place each one with the appropriate information on all the pages. I was faced with numerous setbacks. For example, when I discovered that a handful of cats accidentally had been left off of the PowerPoint, I had to search through hundreds of old emails going back to 2006, double check Jaguar ID's, and repeatedly change all the page numbers.

That said, it definitely all was worth it. Seeing the Jaguar Dossier come to life and knowing that I played an integral part in preserving the history of Jaguarland will be something I cherish forever.

I would like to thank Patricia Martins for all her help throughout the process, Robin Olson for editing my writing, Layra Martins for her guidance and trust, and most of all, Charles Munn, for discovering the wonders of Jaguarland and doing everything in his power to protect this ecosystem.

About SouthWild's Dossier

SouthWild, the leading conservation tourism company in South America, is proud to present the Jaguar Dossier. Every Jaguar's pattern of facial markings is as unique as a human fingerprint. The dossier shows the spot pattern of each of the 200 Jaguars that our guests have photographed in Jaguarland between 2005 and 2022. "Jaguarland" is the name that SouthWild coined in 2007 to describe the uniquely Jaguar-rich 100,000 hectares (250,000 acres) of fields and forests in the north-central Pantanal. It provides the world's best viewing of the big cats in the wild. Our guests observe and photograph Jaguars from boats plying the 100 km of interconnecting river channels 5-40 km upstream from Porto Jofre.

Jaguars on the riverbanks offer particularly beautiful photo opportunities, as the tree trunks and patterns of curved roots and vines offer perfect backdrops for prize-winning pictures.

As you will see, the photos that we use for each cat are of very high quality, allowing the positive identification of each Jaguar that our guests see and photograph. Photos that do not clearly show the spot patterns are not useful for our dossier.

In each Jaguar season, which runs from 1 June through 17 November, our guests typically photograph 85 different Jags, of which 20-30% are new for that year. The

remaining 70-80% are cats that we know from previous years or even decades. The new cats for the dossier are usually photographed for the first time in the early weeks of the season.

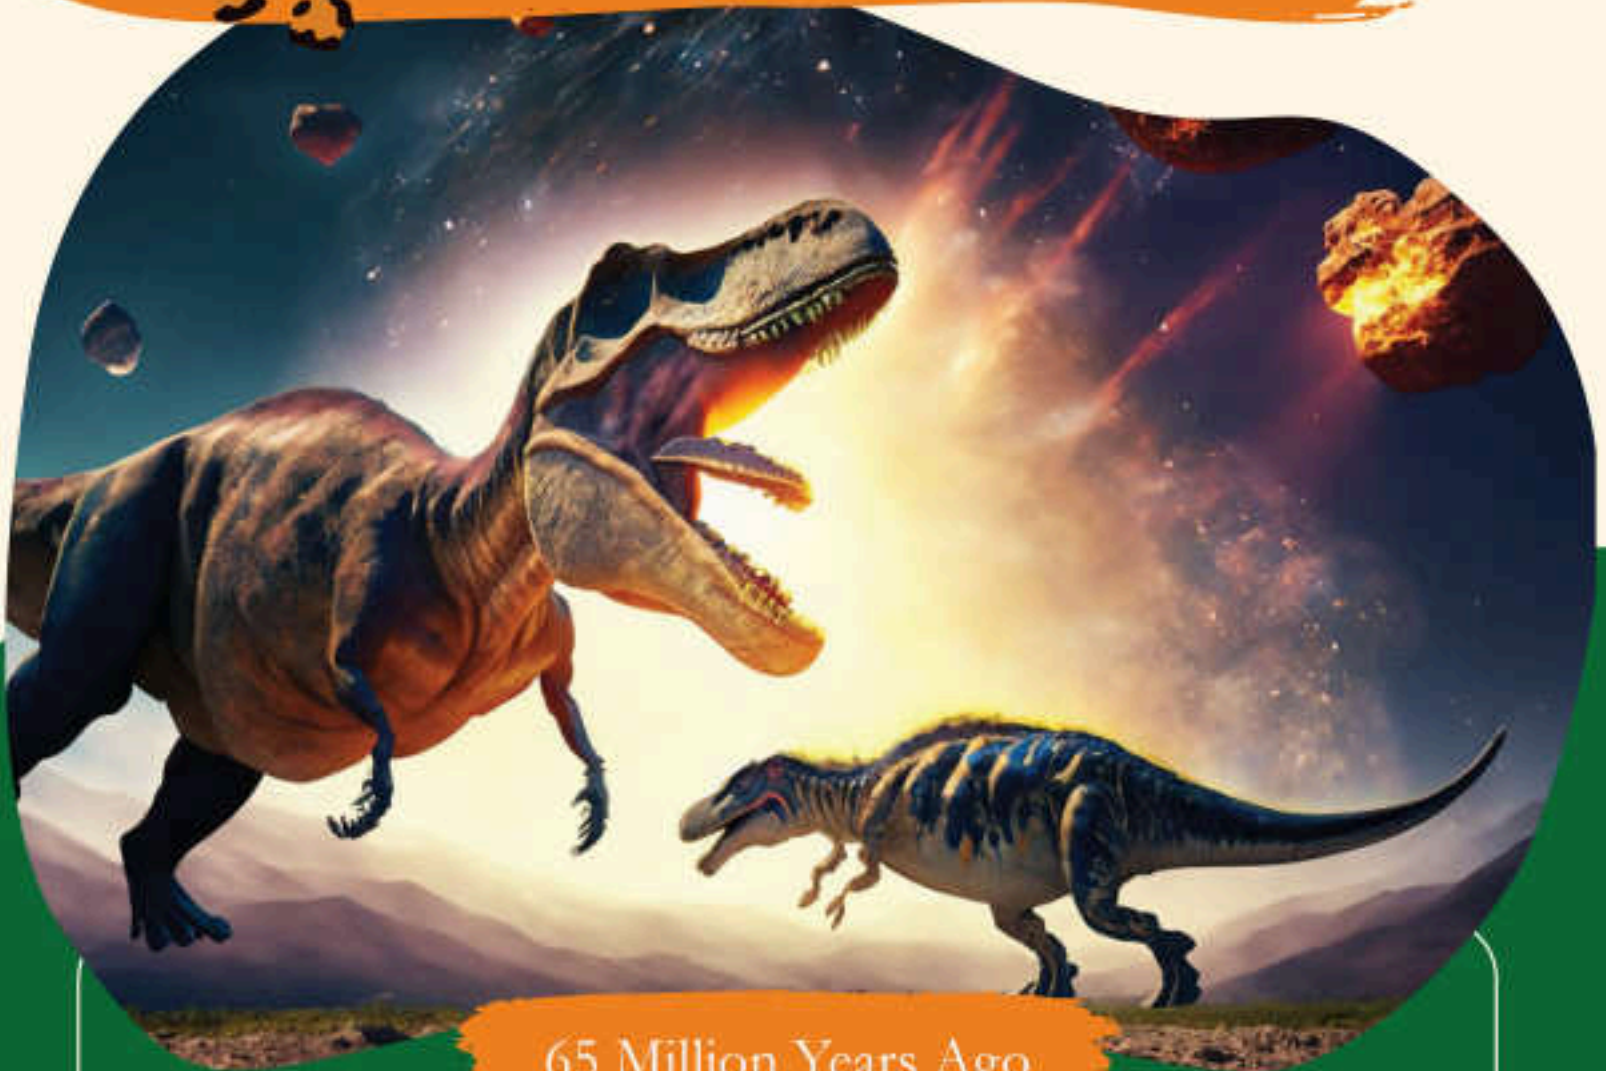

The first guest to give our team a useable photo of a new Jaguar has the right to name it. We only request that the name be easy for Brazilians and English-Speakers to pronounce and to spell. Thus, please avoid names like Schuyler, Thurston, Throckmorton, Cauã, Lolita and similarly-challenging choices. We reserve the right to adjust or reject names that we deem too hard for Brazilians or international travelers to pronounce.

Since 2010, SouthWild has paid more than one million dollars to Pantanal ranchers as compensation for cows killed by Jaguars. To our knowledge, no other tour company in the Pantanal has ever paid a cent to ranchers for cattle taken by the big cats. SouthWild continually works to develop better systems to help create a sustainable, peaceful coexistence for Jaguars and humans. In October 2005, SouthWild issued the world's first "Jaguar Guarantee," a promise of sighting, and we still stand by that pledge. Many other Jaguar tour companies sprung up, but when you choose yours, remember that SouthWild is the original and still the only one who has spent heavily on conservation year after year.

the jaguar story

To understand our beloved, modern-day Jaguar, we must look back at its incredible history of resilience and adaptation on its journey into South America during the Great American Biotic Interchange that took place about a million years ago.

65 Million Years Ago

The Jaguar story begins roughly 65 million years ago, after the extinction of the dinosaurs, when mammals became the dominant vertebrate life forms on earth. We see the first evidence of Felidae (cats) about 10 million years ago, and quite rapid feline diversification between 6-3 million years ago with the formation of the eight ancestral lineages: Panthera, Puma, Ocelot, Lynx, Bay Cat, Domestic Cat, Caracal, and Asian Leopard Cat. The world began to resemble the globe as we know it today, though with a vastly different climate and with sea levels about 100 meters above present levels, making movement between continents very difficult.

2-3 Million Years Ago

Everything changed at the start of the Pleistocene, 3-2 million years ago, which became a defining period for cats. The Pleistocene is more commonly called the "Ice Age," with the first continental glaciation of North America taking place about 3.5 million years ago. Ice sheets were a powerful force altering the topography of the Earth, with repeated melting and freezing causing rocks from high altitudes to shift into lower regions. It also created new seaways and revealed previously submerged land bridges, eventually connecting parts of the globe that previously had been isolated.

In this newly connected world, migrations allowed isolated cat populations to redistribute and interbreed, creating greater genetic diversity among the cats of the Western Hemisphere, Eurasia, and Africa. When sea levels fell, the Beringia land bridge emerged, connecting Asia to North America. Around 3.5-2.5 million years ago, the volcanic Isthmus of Panama emerged, creating a fully connected pathway from Asia through North America to South America. These changes allowed the felids to evolve rapidly into a very successful group of predatory mammals.

Keep in mind that this was a turbulent time in geologic history, with extreme climatic shifts and a great number of interglacial cycles that wiped out many of the biggest and strongest carnivores of the world, including at least 80% of the large-bodied felids. The survival of the Jaguar through this period of cat extinction was already an incredible feat of luck and perseverance.

1 Million Years Ago

The Jaguar that was roaming the forests of Europe a million years ago was almost twice the size of today's Jaguar. With a broad head, massive canine teeth, and short, stocky limbs, that ancient jaguar was built to survive. Fossil evidence from England, Germany, and Spain indicates the presence of Jaguars until at least the middle of the Pleistocene in Europe. The Ice Age survivors made their way as far north as possible, eventually crossing the Beringia land bridge and entering North America roughly 800,000 years ago. From there, the Jaguar traveled southward, arriving in Central and South America between the late middle to late Pleistocene, around 500,000 years ago.

The North American Jaguar became a separate species, 15-25% heavier and with a larger skull and dentition than our modern-day Jaguar. At this point, evidence shows that the North American Jaguar was alive at the same time as its European counterpart, indicating that the Jaguar had achieved a circumpolar population that later became fragmented. Today, the South American Jaguar is the sole survivor of all the Jaguar species of the world.

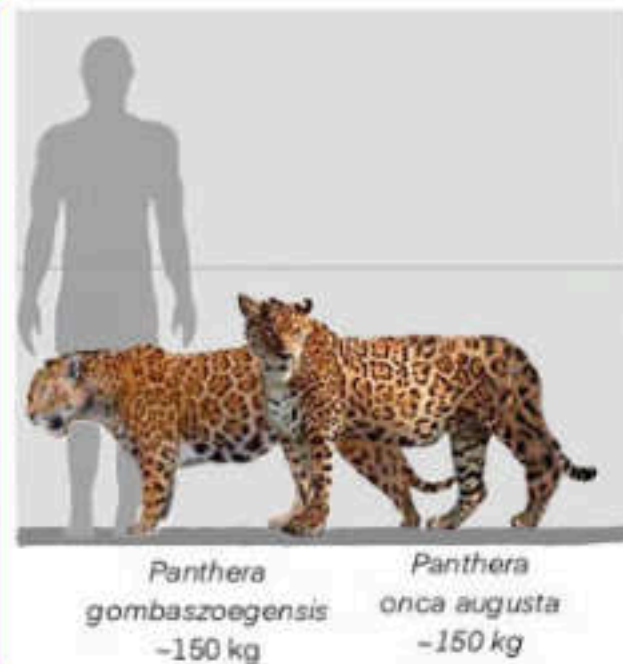

The Jaguar crossed into South America as a part of the Great American Biotic Interchange, when species moved between the Americas across the Panama land bridge. As the turbulent climate continued to change and temperatures warmed, the cooler, open habitats that the big cat favored became warm forests. The Jaguar adapted, becoming smaller in size, with correspondingly shorter limbs while retaining a remarkable bite force, making it highly mobile, resilient, and adaptable. Today, the Jaguar weighs 40-160kg and sports a short, stocky design. A solitary, opportunistic, stalk-and-ambush hunter, adept at tree-climbing and swimming, it is an extremely efficient predator.

humans and jaguar

Since the advent of humans to the Americas, the relationship between people and Jaguars has been one of mutual fear and respect. Jaguars are the most efficient predators in Latin America (after humans, that is). Many different human societies from Mexico to Argentina revered the power of the Jaguar, using totems, magical rituals, art and hunting as ways to relate to the great feline. Humans have hunted

Jaguars for four reasons: out of fear of another top predator, for their pelts, to protect their livestock, and for "sport." During the first three quarters of the 20th century, detailed knowledge about the Jaguar came mainly from sport hunters, who wrote extensively about their hunting exploits. Sport hunting expeditions produced the first scientific accounts of the Jaguar, detailing the behavior, weight, size, and stomach contents of the slaughtered animals.

Cattle Ranchers and Jaguars

There has also been a centuries-old competition between Jaguars and cattle ranchers, who see the big cat as a pest that threatens their livelihood. Jaguars like killing easy prey, and that includes young cows. Therefore, SouthWild has partnered with select local ranchers to pay them for any potential loss of income due to Jaguars killing cattle, thus removing the incentive to shoot Jaguars.

Recent tests of electric fences to protect cows with calves have proven very successful in reducing loss to Jaguars. In fact, losses to Jaguars in the Pantanal currently vary from less than 1% of the cattle herd per year up to 4%. With use of these electric fences and other Jaguar-repelling cattle management methods, the loss can be reduced to less than 0.25%, which is quite an insignificant loss that can be tolerated by ranchers. At that very small level of loss, ranchers have no reason to bother killing Jaguars on their

ranches. All Jaguars in the Pantanal are very good at hunting natural prey such as caimans, capybaras, the two species of wild pigs, and the single species of feral pig. Jaguars here have no real need to eat cows in order to survive.

Wildlife Protection Law

In 1967, Brazil passed the Wildlife Protection Law (Law No. 5197/67) criminalizing wildlife hunting and trade. Naturally, it was difficult to enforce at first and people continued to poach and hunt Jaguars for sport, while ranchers continued to carry out both reprisal and prophylactic Jaguar killing. As time passed, however, the Brazilian government became serious about enforcing the ban and the cultural tradition of Jaguar hunting began to fade, with sportsmen then focusing all their energy on sport fishing. Without guns, sport fishermen who encountered Jaguars on the riverbanks in the best fishing rivers of the Pantanal started to play with the cats by tossing them spare fish. By 2004, some specific Jaguars on the 100 km of river channels upstream from Porto Jofre had learned that small motorboats each carrying 2-3 men were not merely harmless, but often provided tasty snacks. Peaceful coexistence between Jaguars and humans was well demonstrated by the 10,000 Brazilian sports fishermen visiting Porto Jofre every year.

Jaguarland

In August, 2004, Dr. Charles Munn, who was then a well known international conservation biologist, took the advice of ecotour operators Doug Trent and Eduardo Falcão and sent biologist Edilene Gonçalves to investigate their reports of visible Jaguars. For 23 days, Edilene joined

every one of Trent and Falcão's Jaguar outings. One of her Jaguar reports described a bizarrely tame Jaguar relaxing on the banks of the river, just a few kilometers upstream from Jofre. This cat sat like the Sphinx, completely unconcerned about the presence of Trent and Falcão's boat load of tourists floating only 10 meters away. In 2005, trying to understand this miracle of Jaguars habituated to humans, Munn posted three men in two radio-equipped motorboats on the rivers upstream from Jofre and had them do daily boat outings searching for Jaguars. The results were surprising: a 75% chance per day of seeing a Jaguar on the 100 km of river channels that Munn dubbed "Jaguarland". Over the following three years, Munn researched Jaguars on those rivers and learned how the Jaguars became visible thanks to four mutually-reinforcing reasons:

01

Cessation of hunting by humans driving around the rivers in motorboats

02

Jaguars specializing in hunting caimans and capybaras, which live right along the riverbank

03

Tens of thousands of passes per year of small sport fishing boats carrying unarmed humans

04

Those playful sport fishermen tossing fish to the Jaguars.

Eighteen years after South Wild first saw the tame Jaguars on the riverbanks upstream from Jofre, we remain at the cutting edge of what now is a fully mature Jaguar viewing industry. Each year, some 10,000 international visitors spend five to ten nights in the Pantanal. They consistently choose the northern Pantanal for their vacations due to the guarantee of spectacular viewing of Jaguars. When you realize that 90% of those 10,000 travelers come to Brazil for the Jags of Jaguarland, and you add up the money they spend on Brazilian airlines, other "non-Jaguar" lodges in Pantanal, and additional destinations in Brazil such as the Amazon, Iguassu Falls, Rio de Janeiro, and São Paulo, you can calculate that each of the 85 visible Jaguars is worth 750,000 USD per year to Brazil.

Thank you for coming to the Pantanal and helping us in our quest for a sustainable future for nature and humanity.

About SouthWild

We think like the animal.

Brad Pitt's character in "A River Runs Through It" says it will be two years until he can think like a fish. SouthWild's scientists and guides already can and do think like Jaguars, Pumas, Ocelots, condors, Harpy Eagles, macaws and even Giant Anteaters. Their decades of training and field experience allow them to anticipate natural behaviors and discover even the most elusive wildlife, while being aided by one of the largest global networks of scientific advisors.

WCI researcher Dr. Charles Munn promotes the transfer of technical skills in conservation biology to Peruvian graduate students in Manu National Park. Manu holds the current record for diversity of bird species and is one of Amazonia's most pristine natural areas. (Photo: H. Sherman)

SouthWild's Guide to Conservation

01 Persuade the community.

Parks and guards never protect animals as well as a community that understands that the animals are worth more alive than dead. South America's wild animals, particularly the predators, often are still regarded and hunted as pests. South Wild sometimes take years to persuade local people that the wildlife, if visible, can generate economic value much greater than the cost of damaged crops or cattle. It is even possible to turn bad hombres like poachers into zealous guides and guardians for the animals.

02 Fight the right battles.

Exposure is the only way to effectively protect wildlife, and sometimes SouthWild battles for years to be allowed to do it. Our legal team is headed up by one of Brazil's best negotiators and SouthWild wins far more battles than it loses.

03 Have good friends.

SouthWild is greatly aided by an intensely loyal community of clients and travel operators who are as passionate as we are about wildlife adventures and conservation. This network of friends and supporters allows SouthWild to promote new destinations and animals with minimal marketing effort.

Dr. Charles Munn

Southwild is the first wildlife company to be owned and operated by a world-class field biologist. Over the past 30 years, Dr. Charles Munn has created many of the major new wildlife destinations in South America. Munn earned degrees from Princeton (BS in Biology, Summa cum laude, 1977), Oxford (MSc in Zoology 1979) and Princeton (PhD in Ecology and Evolution 1984). His field research was on mixed-species bird flocks of the Amazon rainforest, which are the most complex multispecies assemblages on Earth. This work led to the discovery of lying songbirds, that is, "Birds that 'Cry 'Wolf!'", published in *NATURE* in 1986, featured in *The New York Times*, and then in animal behavior textbooks worldwide.

From 1984 to 2000, Munn was a field scientist for New York Zoological Society (WCS), researching macaws and Giant Otters in Peru, Bolivia, and Brazil.

In 1985, while researching macaws at clay licks in Peru, Munn discovered a new bird species for science, the "Manu" or "Amazonian Parrotlet", *Nannopsittaca dachilleae*. He named it after Peru's leading environmental journalist, Barbara D'Achille, who in 1989 was killed by Shining Path guerrillas in the Andes.

In 1987, Munn served as the director of the Brazilian government/World Wildlife Fund/CITES field survey of the Hyacinth Macaw, which led to the global trade ban of that endangered species. That spectacular macaw has since recovered to viable wild populations.

In 1992, Munn helped pass into law the U.S.A.'s "Wild Bird Conservation Act", which ended the importation into the U.S.A. of wild-caught, exotic birds. He was also the first scientist to discover the wild location of the extremely rare Blue-throated Macaw which, with only 100 individuals in the wilds of northern Bolivia, is one of the world's most endangered birds. At the time, that striking macaw was described only from skins collected in 1888 and then, in the 1970's and 1980's, from living birds in macaw breeding collections in the USA and Europe. By 1992, no scientist had ever seen the species in the wild and it was feared extinct before protection efforts could even begin. That year, Munn solved this 100-year-old ornithological mystery by posing as an advance man for a BBC film crew. In this guise, he met a macaw trapper who showed him that extremely rare bird in the wilds of the "Llanos de Moxos", an extensive, Everglades-like region of northern Bolivia.

In 1993, Munn gave testimony in the USA in a federal prosecution that led to the conviction and imprisonment of Tony Silva, a major bird smuggler from Chicago. As a result, Mr. Silva served seven years in U.S. federal prison for his cruel, illegal importation into the USA of hundreds of Hyacinth Macaws from the Pantanal of Brazil.

Between 1986 and 1998, Munn created a nonprofit Indian-rights group in Amazonian Peru, raising \$1.2 mm that was employed to create a mosaic of 2.5 million protected acres of titled lands for indigenous Amerindians as well as large, new conservation units. The goal was to protect the vulnerable western and northern flanks of Peru's premier Amazonian reserve, the Manu National Park.

In 1998, Munn's three-pronged approach to macaw research, park creation, and ecotourism to support the parks was chosen to grace the cover of a leading conservation biology textbook as the world's finest example of complete, applied conservation biology.

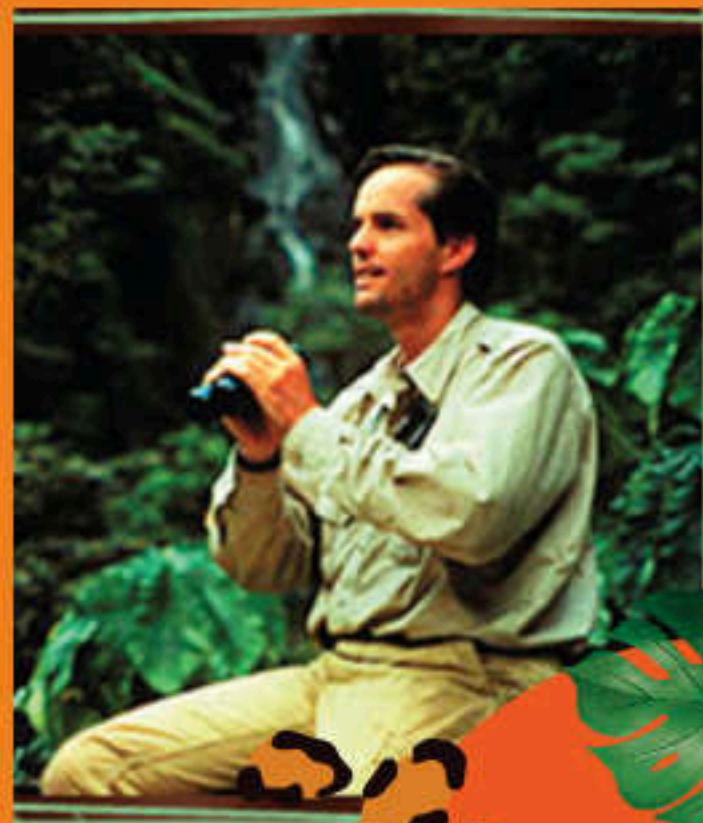

From 1995 to 2000, Munn shifted gears to focus on developing replicable models of ecotourism to save Amazon rainforest and the Pantanal. He formed and led teams that created 15 million acres of new Amazonian parks, an area equivalent to 15% of California or 25% of UK. His work in the Amazon and Pantanal produced 30 lodges, the largest network of ecolodges in the world. Among these were all three of the Amazon's successful, Indian owned lodges.

For the last 12 and 18 years, respectively, Munn has spearheaded the conspicuous growth of conservation tourism of Jaguars in the Brazilian Pantanal and of Pumas in Chilean Patagonia. Since 2013, Munn has

been the operator in the Pantanal for UK-based "Nature Trek", the largest wildlife tour company in Europe, showing wild Jaguars to thousands of guests from all over the world. In 2022, the 85 habituated wild Jaguars living in "Jaguarland" (which represents only one half of one percent of the Pantanal's area) are bringing 65 million dollars of revenue into Brazil each year and have created 1,000 new, full-time jobs.

Since 2015, Munn has worked in the Brazilian Amazon to simultaneously conserve and showcase nests of the world's most massive flying predator, the Harpy Eagle. By August 2022, the project was protecting 35 Harpy Eagle nests and carefully installing temporary viewing towers to allow photographers to snap guaranteed photos from 35 meters or less with a natural treetop background. In October 2020, this eagle conservation work was featured in National Geographic Magazine.

Munn's work has been featured widely in Emmy-Award-Winning TV documentaries, two cover stories in National Geographic

Magazine, The Daily Telegraph, The Independent on Sunday, The Financial Times, TIME, Newsweek, The New York Times, Bloomberg Pursuits, and dozens of other magazines. Condé Nast Traveler chose a Munn lodge as the top wildlife destination in the entire Amazon.

At this point, Munn is the only person in the world to guarantee high-quality, private viewing in completely wild nature of any of the following charismatic animals:

Jaguars in Brazilian Pantanal, Pumas in Patagonian Chile, Ocelots in Brazilian Pantanal, Giant Otters at eight different sites in Peru, Ecuador, Bolivia, and Brazil, Maned Wolves in Northeastern and Southeastern Brazil, Tool-using Bearded Capuchin Monkeys in Northeastern Brazil (discovered by Munn in 2002), and Harpy Eagles in the Brazilian Amazon.

In 1994, TIME chose Munn as one of the 100 young leaders for the planet, one of only three environmentalists. The list included Bill Gates and Condoleezza Rice, among others.
